

The different cores require different thickness lippings with the higher level acoustic doors requiring thicker lippings. As the lippings are concealed, they are not visible and you are unable to see the different lippings.

Offsetting the seals allows for a continuous seal around the lock edge and allows us a space at the door stop to add a batwing seal once the frame is installed in the wall.

With the glazing bead being flush to the face of the door, the vision panels are lined out with Oak before being beaded with a constructed cassette.

The finished Product:
